## Torque Ranges: 150,000 to 4,000,000 lbf-in (17.0 to 452 kNm)

# **Best\* Performance Under Real-World Conditions**

Industries Highest Overrange and Overload
World Class Temperature Performance
Greatest Immunity to External Noise
Very High Stiffness and Low Deflection
Bipolar Rotor Shunt Cal
Accredited\*, CW and CCW Dead Weight Cal
Simple, Non-critical Installation

- 0.05% Accuracy\*, 21,000 Samples/Sec
- 200% & 400% Overload
- 300% Overrange
- 0.0006%/°F Compensation

- 3 kHz Data Bandwidth
- Analog and FM Outputs
- Digital Output with Temperature
- 10 Units of Measure

- 14 Bessel Data Filters
- 48 μS Max/Min Update
- Interface Software Furnished
- Zero Velocity Speed Pickup Options

CRT\* 86000V and 87000V Torquemeters have high accuracy in real-world applications, not just in the cal lab. That's due, in part, to Industries Highest Overrange. High Overrange avoids clipping real-world torque peaks and driveline torsionals. Without high Over-range, clipped peaks produce large measurement errors<sup>1</sup>.

World class temperature performance greatly reduces drive heating and gradient errors. Also enhancing real world performance is noise hardening against electromagnetic interference (EMI) from Variable Frequency Drives, ISM devices and other industrial noise sources - see overleaf.

Bi-directional rotor shunt cal verifies calibration and operation of the entire data chain *in CW and CCW modes*. It

is invoked via stator switches, I/O line or from your computer. Multiple bridges provide immunity to extraneous loads. The short torque path yields high stiffness, low deflection and provides excellent *static and dynamic system response*. The Torquemeter is installed without an additional coupling resulting in a torsionally stiff driveline, with low overhung moment and a short overall length.

The sensors' output is digitized on the rotor and sent to the stator where analog, frequency and Com Port outputs are created. Choose RS232, RS422, or RS485 communications. Included software interfaces with your Windows-based PC. It displays Real-time, Max/Min and Spread Torque, does limit checks, torque versus time plots and stores test results. Password protection may be invoked when needed.

#### **Specification Notes:**

- 1. Outputs may be set at any value equal to or less than the Torquemeter Full Scale Rating. For example: If the Full Scale Rating is 1,000,000 lbf-in, the user may re-scale to 500,000 lbf-in. Then the analog output would be 5 or 10 Volts at 500,000 lbf-in and the digital output, at the Com Port, would be 500,000 lbf-in. However, the above specification still defines measurement accuracy. In other words, you can use this capability to change the scaling but it will not change measurement accuracy; see Application Note 20804 for further details on Torquemeters operated with extended measuring
- 2 In the overrange region all outputs are guaranteed to have combined nonlinearity and hysteresis lower than 0.1% of full scale. This avoids large average and peak torque errors that driveline resonance and pulsating driver and load devices can cause near the high end of the sensor range. See Application Note 20805B for more complete information. Torquemeters have infinite fatigue life for full reversals up to half their overload rating. Above that, you risk a fatigue failure.

If you are using the analog output, it is linear up to 15 volts. That corresponds to 150% of full scale on the 10 volt output setting and 300% on the 5 volts output setting. Accordingly, when using the analog output and if you expect torque peaks greater than 150% of full scale, you should switch to the 5 volt setting.

3. Assumes torque range is set to the device full scale torque rating.

- CW torque causes CW rotation if viewed from the driving end. CCW torque causes the opposite rotation.
- Power input and all outputs are protected. Digital inputs are reverse polarity and over-voltage protected.
- Torque signal bandwidth upper limit is 3 kHz determined by the integral anti-aliasing filter. Realizable, installed measurement bandwidth is limited by driveline components. A Torquemeter's principle contribution is determined by its torsional stiffness; see Application Note 221101D for further information.
- 7. Analog noise is measured by an Agilent U1520A Scope with bandwidth set to 10 kHz.
- 8. A 20 foot long Torquemeter to RS422/485 PC port cable is shipped with each Torquemeter. That communication portocol provides for long, robust connection in a noisy industrial environment, and permits connection of multiple Torquemeters to a single, host computer. An optional USB to RS422/485 adapter is (P/N 330-0003) if your PC has only USB ports. Should you prefer to use the RS232 interface and your computer has an integral RS232 port, you may order a Torquemeter to PC cable; P/N 224-8359-20 is 20 feet long, P/N 224-8350-50 is 50 feet long.
- 9. Fused and reverse polarity protected.

#### EXCEPTIONAL IMMUNITY TO NOISE AND INTERFERENCE FROM ISM TRANSMITTERS

To achieve short length, high stiffness and wide signal bandwidth, bearingless sensors use unshielded antennae. As a result, any device operating at or near their operating frequency, can cause interference.

FCC rules allow Industrial, Scientific and Medical (ISM) devices to generate unlimited energy. High-power ISM devices are commonplace and are used for inventory control, parts tracking,

controlling personnel access, etc. Most bearingless Torquemeters use an ISM frequency and are susceptible to Interference from other ISM devices. Those Torquemeters risk violation of FCC regulations since unlicensed use is only allowed in a narrow band.

Himmelstein Bearingless Torquemeters use non-ISM frequencies and have field strengths within FCC rules. If interference is encountered, they automatically switch to a clear channel.

#### ORDER NUMBER FORMAT → MCRT® A B C D

- **A** = Model Number from tables; either 86007V or 87007V.
- $\mathbf{B}$  = Range from tables above or on previous page; (3-5) or (5-5), etc.
- **C** = Performance Code; N for Standard Performance or C for Enhanced Performance
- **D** =Optional Zero Velocity Speed Pickup; N for None, Z for Magnetic Type, O for Optical Type.

**ORDER NUMBER EXAMPLE** → **MCRT® 86008V(5-5)CO** specifies a Bearingless Torquemeter with a 500,000 lbf-in Torque Rating, a 200% Torque Overload Rating, Enhanced Performance and an Optical Speed Pickup.
